NT This protein, synthesized in the liver, circulates as a noncovalent complex with high molecular weight (HMW) kininogen.

NT The zymogen is activated by factor XIIa, which cleaves the molecule into a light chain, which contains the active site, and a heavy chain, which associates with HMW kininogen. These chains are linked by one or more disulfide bonds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ##molecule_type mRNA

                                        This enzyme is found in urine in a high molecular mass form, consisting of A and B chains, and a low molecular mass form, consisting of Al and B chains.

Urokinase-type plasminogen activator proteolytically activates plasminogen, and the inactive single-chain form is proteolytically activated by plasmin (see PIR:PLHU).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Scoring table: PAM 150 Gap 11

Searched: 142080 seqs, 47172406 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: pir62
1:pir1 2:pir2 3:pir3 4:pir4

Statistics: Mean 37.625; Variance 64.653; scale 0.582

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

##note the reported molecular weight of this protein,

designated Mac-2-binding glycoprotein 2 (M2BP-2), was

70K; the amino-terminal sequence of a related form of

98K, designated M2BP-1, could not be determined
